                                                                 4.58, 4.72, 4.86, 5.00])
                        # Calculating the least-squares line coefficient
                        n = len(x)
                        sum_x = np.sum(x)
                        sum y = np.sum(y)
                        sum_xy = np.sum(x * y)
                        sum_x_squared = np.sum(x ** 2)
                        # Slope (m) and intercept (b) formulas
                        m = (n * sum_xy - sum_x * sum_y) / (n * sum_x_squared - sum_x ** 2)
                        b = (sum_y - m * sum_x) / n
                        # Least-squares line equation
                        line_eq = lambda x: m * x + b
                        # Plotting the data and the least-squares line
                        plt.scatter(x, y, label='Data')
                        plt.plot(x, line_eq(x), color='red', label='Least-Squares Line')
                        plt.xlabel('x')
                        plt.ylabel('y')
                        plt.legend()
                        plt.show()
                        print("Slope (m):", m)
                        print("Intercept (b):", b)
```

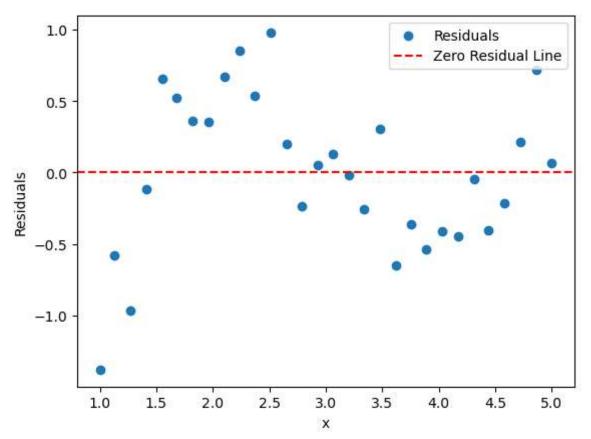

Slope (m): 0.7029398624005561 Intercept (b): 13.936127465489532

2

```
In [4]: # Calculate residuals
    residuals = y - (m * x + b)

# Plot residuals
plt.scatter(x, residuals, label='Residuals')
plt.axhline(y=0, color='red', linestyle='--', label='Zero Residual Line')
plt.xlabel('x')
plt.ylabel('Residuals')
plt.legend()
plt.show()
```

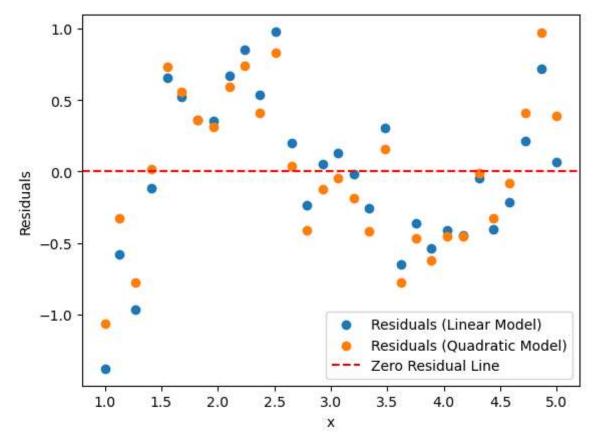

If the residuals exhibit a random pattern around zero, it indicates that the model is a good fit. If there is a pattern or trend, it suggests that the model may not be suitable.

3

```
In [5]: # Fit a quadratic model
    coefficients = np.polyfit(x, y, 2)
    quadratic_fit = np.poly1d(coefficients)

# Calculate residuals for the quadratic model
    residuals_quadratic = y - quadratic_fit(x)

# Plot residuals for both models
    plt.scatter(x, residuals, label='Residuals (Linear Model)')
    plt.scatter(x, residuals_quadratic, label='Residuals (Quadratic Model)')
    plt.axhline(y=0, color='red', linestyle='--', label='Zero Residual Line')
    plt.xlabel('x')
    plt.ylabel('Residuals')
    plt.legend()
    plt.show()
```

residuals for the linear model and the quadratic model to assess which one provides a better fit
